ACME CORPORATION

Policy handbook

People. Operations. Accountability.

Consolidated reference / Edition 1.0

Knowledge reference date: September 11, 2026

SYNTHETIC BUSINESS KNOWLEDGE / ACME-P01

A practical guide to the operating policies of a fictional 120-person software and consulting company. Consistent with the Acme v1 company, department, leadership, and policy baseline.

All organizations, people, customers, vendors, and financial examples are fictional. This is a supplemental PDF fixture, not a new policy approval or a change to the fixed 50-document evaluation corpus.

REFERENCE GUIDE / ACME-P01

Using this handbook

Use the contents below to jump to a section. Source-record links lead to the register at the back. This edition reflects knowledge available on **September 11, 2026**; it does not assume that later targets or assigned actions were completed.

DOCUMENT CONTROL
Organization: Acme Corporation
Audience: All six departments
Scope: Consolidated company facts and operating policies
Authority: Existing controlled source records retain their effective dates and decision rights.

Contents

Company & decision owners	3
Requests, records & handoffs	4
Working arrangements & expenses	5
Software purchasing authority	6
From request to purchase order	7
Identity & production access	8
Data retention & safe evidence	9
Release, rollback & recovery	10
Support & incident communications	11
Customer commitments & readiness	12
Authority, ambiguity & safe use	13
Source records	14
Source records / continued	15

All amounts are USD. Operational times are UTC where stated. A handbook summary does not replace the source's scope, effective date, required approvals, or evidence. No salary, holiday calendar, or unresolved hosting decision is supplied by this edition.

POLICY HANDBOOK / 01

Company & decision owners

Acme Corporation is a fictional software and consulting company with a primary Atlanta office and a remote workforce. The following is its September planning baseline, not a live employee roster.

Department	Employees	Department lead
Engineering	38	Priya Shah
IT Operations	12	Jordan Blake
Customer Success	24	Samira Cole
Sales and Marketing	20	Avery Stone
Finance and Procurement	14	Elena Ortiz, CFO
People Operations	12	Nora Ellis
Total	**120**	Maya Chen, CEO

Leadership roles are included in the 120-person total, not added to it. Procurement is a team within Finance and Procurement. **Company-wide** describes a document's scope; it is not a seventh department.

Services and projects are different

The four service lines are **Atlas** workflow automation, **Beacon** operational analytics, **Harbor** managed integrations, and fixed-scope advisory services. Active internal projects are Cedar, Aurora, Ledger, and Compass. Access Cleanup is completed.

Keep decision rights separate

Maya Chen approves company strategy. Priya Shah owns Engineering priorities and technical quality. Jordan Blake owns operational readiness and production infrastructure. Elena Ortiz owns financial controls. Technical approval is not permission to spend, and an approved budget is not purchase authorization.

Samira Cole owns customer communications and onboarding. Avery Stone owns approved messaging and proposals; Sales cannot promise an unapproved delivery date. Nora Ellis coordinates employee services, onboarding, and training records.

Source records: ACME-001 / ACME-002 / ACME-003 / ACME-004 / ACME-005 / ACME-006. Full titles and owners appear in the source register.

POLICY HANDBOOK / 02

Requests, records & handoffs

Route work to its accountable owner and retain evidence in the correct system. A conversation, orientation meeting, or green dashboard does not by itself establish approval or completion.

System / record	Use it for	Ownership / boundary
BridgeDesk	Internal service and access requests	IT Operations runs the service; People Operations coordinates employee access events.
ClientDesk	Customer support cases and case clocks	Customer Success owns customer communications and case handling.
ProcureFlow	Purchase requests, approvals, vendor reviews, purchase orders	Finance validates funding; Procurement reviews terms and issues purchase orders.
LedgerOne	General ledger	Finance and Procurement owns financial recording and classification.
Software Budget / CC-410	Software expenditure cost center	Include the project name too; several projects share this cost center.

Operational contacts

Morgan Reed is the SRE lead and primary incident commander. Imani Brooks is the incident coordination backup and the operational contact for production access and SSO. Morgan is the operational contact for backup and restore; Jordan Blake is accountable for both access and recovery services.

A complete handoff carries evidence

Engineering provides code-level fixes, proportionate tests, schema compatibility, and rollback instructions. IT Operations checks monitoring and recovery readiness. Customer Success receives approved release notes before customer rollout and sends external updates after technical facts are checked.

> **JOINT APPROVAL MEANS BOTH**
> For Atlas release readiness, Priya Shah and Jordan Blake are jointly accountable. Theo Park and Morgan Reed provide the readiness evidence. Either department acting alone does not satisfy the joint approval.

Source records: ACME-002 / ACME-003 / ACME-004 / ACME-005 / ACME-007 / ACME-010. Full titles and owners appear in the source register.

POLICY HANDBOOK / 03

Working arrangements & expenses

People Operations, led by Nora Ellis, coordinates employee onboarding and training. Finance and Procurement reviews expense purpose, evidence, and coding. These rules do not establish compensation or benefit entitlements.

Hybrid work and travel approval

Teams agree on collaboration days with their manager. Remote participation is supported for internal meetings unless the event explicitly requires a physical activity. No mandatory number of office days is established.

Obtain manager approval **before booking work travel**. Record the purpose, estimated cost, dates, and project. Customer-billable travel also requires the engagement owner's confirmation that the signed statement of work permits reimbursement. Trip approval does not approve unrelated software spending.

Expense control	Requirement
Submission deadline	Within 30 days after the trip ends.
Meals	$65 per person per travel day, including taxes and tips.
Receipts	Itemized receipts for expenses over $25.
Review and exceptions	Finance reviews purpose and cost-center coding. Missing evidence is returned for correction. Exceptions require a documented Finance decision before reimbursement.

First-week onboarding

Before day one, the manager records role, systems, and access owner in BridgeDesk. People Operations confirms orientation and training; IT Operations provisions approved standard access through SSO. Production elevation is not part of the standard account bundle.

Days one and two cover account verification, required MFA enrollment, safe-data handling, and recognition of controlled versus archived or draft policies. Days three and four cover team ownership, release gates or customer handoffs, and relevant financial controls. On day five, the manager verifies role-appropriate access, account ownership, and training completion; gaps become owned tasks with due dates.

> **ASK RATHER THAN INFER**
> This collection sets no international per-diem schedule, mileage rate, visa policy, family-travel allowance, salary schedule, or international leave policy. Request an approved rule from People Operations instead of inventing one.

Source records: ACME-005 / ACME-017 / ACME-047. Full titles and owners appear in the source register.

POLICY HANDBOOK / 04

Software purchasing authority

Procurement Policy v2.1 and the Finance Approval Matrix govern from August 1, 2026. Elena Ortiz owns financial controls; Ravi Desai leads Procurement. Apply the policy effective when commitment occurs.

USE THE FULL COMMITMENT
Evaluate total annual committed software cost, including mandatory fees, rather than the first monthly invoice. Splitting requests to avoid review is prohibited. A project budget or favorable quote does not authorize purchase.

Annual committed cost	Business / financial approval	Additional review
At or below $5,000	Manager and Finance	IT Operations for any new software.
Above $5,000 through $20,000	Manager and Finance	IT Operations and Procurement.
Above $20,000	Manager, Finance, and CFO or documented delegate	IT Operations and Procurement.

Threshold examples

Amount	How to apply the matrix
$5,000	First band. For an already-approved renewal, apply the unchanged-scope and unexpired-review conditions below.
$5,000.01	Full IT Operations and Procurement review is required.
$20,000	Middle band; the additional above-$20,000 CFO rule is not triggered.
$20,000.01	CFO or documented delegate approval is additionally required.

New software always needs IT Operations review, regardless of price. An existing approved renewal may reuse an unexpired technical review only if its scope has not changed. Requesters cannot approve their own purchases.

No standing CFO delegate is named. A valid delegation must identify its scope, amount limit, and validity period in the request record. Advisory-service agreements follow their signed statement of work, rather than these software-only bands.

Source records: ACME-011 / ACME-012. Full titles and owners appear in the source register.

POLICY HANDBOOK / 05

From request to purchase order

A complete approval trail distinguishes business need, funding, technical suitability, commercial terms, and final authority. Record approvals in ProcureFlow and retain the purchase-order reference.

01 Prepare the request. For software over $5,000, create the ProcureFlow request with business justification, vendor details, annual committed cost, project, and cost center. Include the project name with CC-410 where applicable.

02 Establish need and funding. Finance validates available funding; the manager confirms business need; Finance reviews compliance. Budget availability alone is not authority to commit.

03 Complete the reviews. IT Operations checks security, licensing, and integration. Procurement reviews vendor terms. Add CFO or documented delegate approval above $20,000.

04 Issue and retain the order. Procurement issues the purchase order once the required approvals are in place. Contract originals belong in the vendor record; keep the approval evidence in ProcureFlow.

05 Check the invoice trail. Invoices lacking a purchase-order reference are returned for investigation rather than automatically paid. Customer deliverables belong in the project workspace.

Worked case: Nimbus Compute

The proposed renewal is **$1,900 per month for twelve months = $22,800**. That exceeds $20,000, so manager, Finance, IT Operations, Procurement, and CFO or documented delegate approval are required. The $24,000 annual ceiling leaves $1,200 of headroom only if no additional mandatory fees apply.

Ravi Desai owns vendor terms; Jordan Blake reviews operational and security scope; Elena Ortiz owns the financial decision. The vendor record must pass Ledger's duplicate review before commitment. If mandatory fees exceed the ceiling, return for a revised budget decision. The assessment is not an executed agreement or purchase order.

> **EMERGENCY AND HISTORICAL REQUESTS**
> Emergency spending needs a recorded CFO exception before commitment. Preserve approvals for requests already committed before August 1. An uncommitted draft must use the policy effective at commitment; do not carry old thresholds forward.

Source records: ACME-004 / ACME-011 / ACME-012 / ACME-018 / ACME-049. Full titles and owners appear in the source register.

POLICY HANDBOOK / 06

Identity & production access

Jordan Blake owns the Production Access Procedure. Central identity authenticates employees, while application and infrastructure permissions remain separate. Use the least-privilege role required for the task.

Request, review, and grant

01 Open a **BridgeDesk** request specifying the system, business reason, requested role, and expiry.

02 The manager confirms business need. **IT Operations approves the technical role** and records the reviewer and grant.

03 Use company **SSO and MFA for every production session**. Shared personal accounts are prohibited.

04 Verify only the actions required for the task. Record who granted access, when it expires, and how it was removed.

> **FOUR HOURS MAXIMUM PER ELEVATION GRANT**
> The limit also applies during incidents. An incident commander may accelerate review but must retain the ticket and reviewer record. If work takes longer, request a new grant with updated justification; do not silently extend the existing grant.

Review and revocation

IT Operations reviews production membership monthly and records exceptions in BridgeDesk. People Operations triggers immediate access removal for departures through the approved internal workflow. Employee departure details do not belong in the synthetic knowledge base.

Application admin is not infrastructure admin

Engineering enforces application permissions in backend handlers. IT Operations configures identity integrations and infrastructure grants. A product administrator label does not grant database-superuser or infrastructure access; implicit mapping is prohibited. An expired infrastructure grant must fail even if the application admin role remains active.

A hidden menu is not authorization enforcement. Privileged operations require permission checks; verification should cover missing roles, expired grants, and revoked accounts. The source architecture decision states the intended company design, not proof that a demonstration application's authentication wiring implements it.

Never copy production credentials or recovery codes into tickets, documents, or knowledge-base uploads.

Source records: ACME-003 / ACME-013 / ACME-035 / ACME-047. Full titles and owners appear in the source register.

POLICY HANDBOOK / 07

Data retention & safe evidence

Data Retention Standard v2 took effect August 10, 2026. Jordan Blake owns the standard. Select the record class and the correct clock before calculating eligibility.

Record class	Retention period	Clock starts
Application audit events	365 days	Event time
Support attachments	90 days	Support case closure
Operational backups	30 days	Backup creation

These are distinct obligations. A 30-day backup window does not shorten application audit retention, and the support-attachment clock does not begin when the attachment was uploaded. If a question does not identify the record class, ask for clarification.

Deletion and verification workflow

01 The owning service marks records eligible when their retention clock expires.

02 A scheduled job removes eligible records and produces a deletion-count report.

03 Customer Success confirms support case closure. Engineering owns application deletion jobs. IT Operations owns backup expiry.

04 Monthly sample checks compare stored timestamps with the correct eligibility rule. A documented hold pauses deletion only for the explicitly covered records.

> **BEACON: REQUIRED POLICY VERSUS OBSERVED COMPLIANCE**
> The controlled rule is 365-day audit retention. Beacon's draft administration guide says 180 days; that draft is not an approved exception. Leo Martin must reconcile the guidance and validate the implementation. Jordan Blake reviews the evidence. No later closure record is included as of September 11, 2026.

The August 29 review requested the configuration source, sample audit-event timestamps, eligibility calculation, and deletion-job test results. Use synthetic timestamps around the retention boundary rather than production customer data. Editing the guide alone does not prove the implementation complies.

No actual legal hold or jurisdiction-specific retention requirement is established by the source collection. Do not invent one or treat informal product notes as an approved exception.

Source records: ACME-014 / ACME-020 / ACME-032 / ACME-038 / ACME-044. Full titles and owners appear in the source register.

POLICY HANDBOOK / 08

Release, rollback & recovery

Morgan Reed owns the Release and Rollback Procedure. Production readiness requires Engineering and IT Operations sign-off, with evidence that the business workflow and recovery path work.

ROUTINE PRODUCTION WINDOWS
Tuesday or Thursday, 18:00-20:00 UTC. Record a named operator, test evidence, migration compatibility, monitoring links, rollback steps, and both departmental approvals. Customer Success receives the approved release note before a customer-facing rollout.

Release sequence

Take the pre-change recovery checkpoint, deploy to the canary group, verify business transactions, and compare application error rate with baseline. Expand only after the canary check is accepted. Test an actual Atlas approval transaction or Beacon report retrieval; a green deployment command is not enough.

Condition	Required response
Error rate exceeds 2% for five consecutive minutes	Begin rollback.
Tenant isolation is breached	Begin rollback immediately.
Evidence suggests customer data risk	The incident commander may stop earlier.
Rollout or rollback has completed	Validate business behavior and observe for 30 minutes; attach results to the change record.

Make database changes reversible

Use expand-and-contract migrations: add the new representation, deploy code compatible with both, backfill with validation, and defer destructive cleanup until the rollback window is formally closed. Engineering supplies current/previous-version compatibility tests. Backfills must be resumable and report counts. A non-reversible data correction requires a separately reviewed recovery plan.

Restore evidence is part of readiness

Morgan's evidence includes the selected backup, test environment, measured recovery time, validation results, and cleanup confirmation. The August 27 synthetic-data drill took 95 minutes against a 60-minute target; 35 minutes were spent resolving an obsolete credential reference. It was not a customer outage and did not create a new recovery target.

Jordan reviews the repeat-exercise sign-off. Cedar's rollback gate remains until evidence is accepted. Emergency releases still require named reviewers and retrospective evidence; urgency changes timing, not accountability.

Source records: ACME-002 / ACME-007 / ACME-010 / ACME-015 / ACME-036 / ACME-042. Full titles and owners appear in the source register.

POLICY HANDBOOK / 09

Support & incident communications

Customer Success assigns initial severity and updates it when evidence changes. Samira Cole's team owns customer communications; the incident commander checks technical facts.

Severity	Classification	Initial response	Updates
P1	Multi-customer production outage or suspected cross-tenant data exposure	15 minutes, 24/7	Every 30 minutes until stabilized
P2	Major function impaired, with a workable alternative	Four business hours	Once per business day
P3	Routine question or minor defect	One business day	At meaningful progress or closure

START THE RIGHT CLOCK
Response time starts at ClientDesk case creation. Business hours are Monday-Friday, 09:00-17:00 UTC, excluding the published company holiday calendar. No holiday calendar is included here; clarify possible holidays before calculating a deadline across them.

Escalate and communicate

01 Route suspected outages to Morgan Reed, the primary incident commander; Imani Brooks is the backup. An unavailable primary must not delay severity assignment or customer notification.

02 Engineering assesses code fixes and rollback. Customer Success communicates known impact, current mitigation, and the next update time after technical facts are checked.

03 Do not invent a root cause or guarantee a resolution time. An initial response target is not a recovery-time objective or a contractual service-credit promise.

Harbor: attempts are not retries

The connector contract permits **five attempts total**: one initial attempt and four retries, with waits of 1, 2, 4, and 8 minutes after the first four failures. After the fifth failure, move the event to the dead-letter queue and open an operational alert. There is no sixth automatic attempt.

Retry timeouts and temporary server failures. Authentication failures and invalid payloads require investigation. Correct the cause and authorize replay while preserving event identity. Record correlation ID, attempt, outcome class, and next eligible time without secrets or full customer payloads. The 15-minute backoff sum excludes attempt execution time; it is not a delivery deadline.

Source records: ACME-003 / ACME-016 / ACME-037. Full titles and owners appear in the source register.

POLICY HANDBOOK / 10

Customer commitments & readiness

Do not convert a planning target, incomplete proposal, or successful pilot into an approved launch or contractual commitment. Verify the specific project's scope, current status, and acceptance evidence.

Cedar / Atlas

Priya Shah sponsors Cedar and Theo Park leads delivery. Release needs passing approval-path regression tests, no open tenant-isolation finding, an accepted rollback drill, and joint Engineering/IT Operations readiness approval. A pass in the three-workspace pilot supports rollout consideration; it does not automatically authorize general availability. Later status reports and steering decisions control the forecast, not the initial charter date.

Aurora / Beacon

Leo Martin leads Aurora, with Priya Shah as sponsor and Jordan Blake reviewing operational evidence. The October 6, 2026 limited-pilot target is conditional. The pilot needs a documented region decision, retention evidence, and a customer communication plan. No general-availability date, approved European hosting region, cross-region recovery target, or approved migration sequence is established.

Sales material must describe Aurora as a planned pilot until its gates close. A workshop preference or vendor quote does not settle data residency. Use synthetic test datasets; do not copy customer data into fixtures to accelerate readiness checks.

Compass / customer onboarding

Samira Cole leads Compass across Atlas and Harbor. Pinecrest Services is the initial fictional pilot customer. The accepted-handoff target is **ten business days after all prerequisites are complete**: signed scope, named customer administrator, approved test data, and validated access. An informal sales introduction or unsigned proposal does not start this clock.

Completion requires the customer administrator to demonstrate the agreed workflow and Customer Success to accept the support handoff. Retain the kickoff checklist, responsibility map, configuration record, and acceptance note. Count missing prerequisites separately from execution delays. Custom connectors must not be promised under the standard onboarding commitment.

> **EVIDENCE, NOT IMPLICATION**
> An assigned action is not proof of completion. An approved project envelope does not authorize a purchase. A successful backup is not a tested restore. State what the evidence supports and route unresolved decisions to their owner.

Source records: ACME-005 / ACME-019 / ACME-020 / ACME-022 / ACME-038 / ACME-042. Full titles and owners appear in the source register.

POLICY HANDBOOK / 11

Authority, ambiguity & safe use

This handbook consolidates the source records as of September 11, 2026. It adds no approvals, delegation, new benefits, contractual terms, or evidence that open actions were completed. Refer to the controlled source for the governing rule.

Resolve contradictions explicitly

Question	Use this interpretation
Which procurement thresholds apply?	Use policy v2.1 and the approval matrix for commitments on or after August 1. Archived v1.4 governs the documented earlier period.
A newer office-hours note suggests a different CFO threshold	The informal note does not amend the controlled policy or matrix. Confirm authority and effective date rather than choosing the newest edit.
Beacon draft guidance says 180 days	The controlled audit-event rule is 365 days. The August 29 review did not approve an exception, and implementation closure is not recorded.
Where will European Beacon data be hosted?	The regional storage proposal is unresolved. Leo Martin owns the decision gap; do not guess a location.

Clarify before giving a single answer

Ask which project a launch question concerns; distinguish a historical target, current forecast, pilot, and general availability. Ask for the purchase commitment date when a policy version changes the answer. Ask for the record class and clock-start event before calculating retention. Distinguish an application-admin request from production infrastructure access.

Use traceable, synthetic evidence

Cite source IDs and titles when handing off an answer. Preserve archived and draft status labels; their presence is not approval to apply them as current policy. Escalate unknown policy to the named owner instead of presenting a likely rule as fact.

Do not put credentials, recovery codes, bank instructions, or full customer payloads into operational notes. Keep real employee payroll, salary, personal contact, accommodation, or medical information out of the demonstration knowledge base. Use fictional cases and timestamps for practice and verification.

SUPPLEMENT TO THE FIXED CORPUS

ACME-P01 is a consolidated PDF fixture, separate from the canonical ACME-001 through ACME-050 Markdown documents. Its overlapping content can affect retrieval and evaluation; include it only in an explicitly identified supplemental ingestion run.

Source records: ACME-005 / ACME-011 / ACME-012 / ACME-013 / ACME-014 / ACME-018 / ACME-028 / ACME-032 / ACME-037 / ACME-038 / ACME-047 / ACME-048. Full titles and owners appear in the source register.
